Question 1: Incorrect! The correct answer is: **b) Divide the sum of each class's F1 score by the total number of classes.**

The weighted F1 score is calculated by multiplying the number of class 1 examples by the F1 score of class 1, and similarly for class 2 and class 3. These values are then summed up and divided by the total number of classes to obtain the weighted F1 score. This takes into account the performance of each class while considering their relative weights in the dataset.

Score: 0%
